

Subscription Paywall A/B Test Analysis

Impact of discount framing on premium subscription conversion

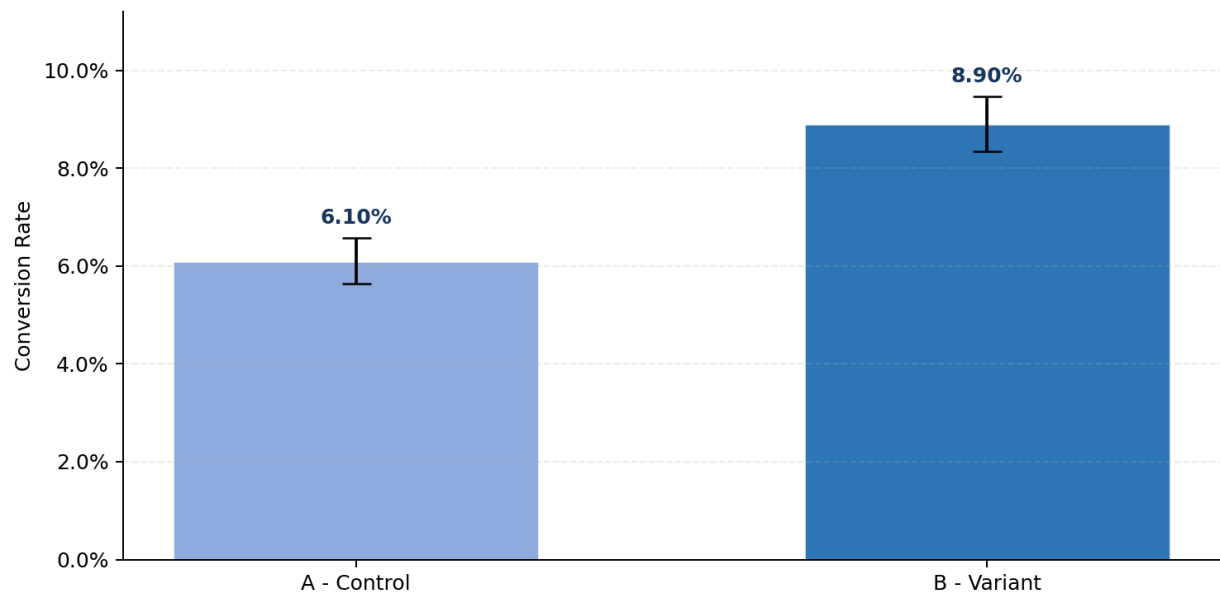

Experiment: Group A saw the standard \$4.99 weekly subscription offer. Group B saw the same price framed as a 50% discount. The primary outcome is purchase conversion.

Key Results

Group	Users	Conversions	Conversion Rate	95% Confidence Interval
A - Control	10,013	611	6.10%	5.63% - 6.57%
B - Variant	9,985	889	8.90%	8.34% - 9.46%

+2.80 pp Absolute lift	45.91% Relative lift	7.52 Z-statistic	p < 0.001 Statistical result
---------------------------	-------------------------	---------------------	---------------------------------

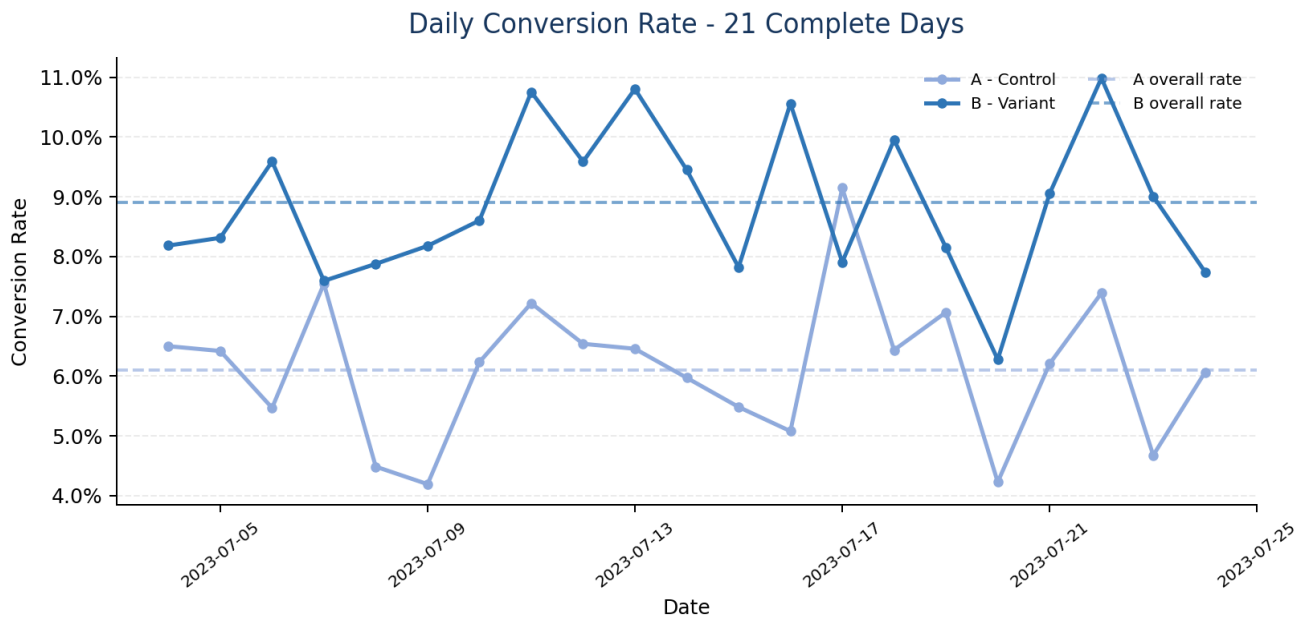

Conversion Rates with 95% Confidence Intervals

Test period: Jul 03, 2023 01:42 - Jul 25, 2023 01:41 (23 calendar days). Error bars show 95% confidence intervals.

Performance Over Time

Daily results fluctuate, but the variant outperformed the control on most complete days. Dashed lines show the overall conversion rate for each group.

The trend chart includes the 21 complete days from July 4 to July 24. Partial boundary days were excluded only from this visualization; all 19,998 users remained in the primary hypothesis test.

Hypothesis Test and Decision

Method: One-sided two-proportion z-test. $H_0: p_B \leq p_A$. $H_1: p_B > p_A$. The result was $z = 7.52$ and $p = 2.75e-14$. Because p is far below 0.05, H_0 is rejected.

Recommendation: Roll out Variant B gradually.

The variant increased conversion from 6.10% to 8.90%, a gain of 2.80 percentage points. This exceeded the predefined +2 percentage-point minimum detectable effect and is meaningful both statistically and commercially.

Next Steps

1. Release Variant B to a limited user segment before full rollout.
2. Continue monitoring conversion and technical data quality during rollout.
3. Add guardrails for refunds, revenue, retention, and complaints in production.
